LANDOWNER INFORMATION FOR OIL/GAS/MINERAL LEASES

An oil/gas/mineral lease is an important legal document that defines the relationship between the Lessor – the landowner (or the owner of the mineral rights) and the Lessee – the party interested in producing/extracting the oil, gas or other minerals. The lease defines the rights, privileges and responsibilities of the parties. Landowners should seek professional assistance in reviewing the lease terms prior to signing a lease because provisions contained in leases offered by Lessees may be unfamiliar and will not necessarily be in the best interest of Lessor.

Negotiating an Oil and Gas Lease

Before any exploration can begin, the landowner (Lessor) and the oil company (lessee) must agree to certain terms regarding the rights, privileges and obligations of the respective parties throughout the exploration and possible production stages. Negotiation of these terms may be a landowner’s first exposure to an oil and gas lease. Because of the complex legal nature of the leasing arrangement, novice landowners may be at a disadvantage when dealing with an experienced landman or oil company. An oil and gas lease is both a contract and a conveyance of an interest in land. When you sign an oil and gas lease, you have essentially “sold” a part of your property. Obtaining a good lease is a negotiation. Almost everything is negotiable. Don’t be rushed into making a decision. To obtain a good lease it may take a long time, but last a long time. You may not come to an agreement – that is OK if it is not what you feel is fair.

Get verbal promises in writing. Leases are bought and sold. The company that actually explores for minerals may not be the company that negotiated the lease. If it is not in writing it cannot be enforced.

No standard lease form is universally recognized and used by the oil and gas industry. Instead, each company (or independent lessee) has a pre-drafted agreement that has proven suitable to them in the past. These agreements may not necessarily be in the best interest of the landowner.
Landowners should remember that all provisions of a lease are negotiable within reason. Even though the oil company representative or landman soliciting the lease may not have the authority to make changes, this does not mean certain clauses, or the complete lease itself, may not be altered. However, one’s ability to negotiate more favorable terms will vary in each situation. Naturally landowners in areas considered “hot” will have more negotiating power than landowners in areas with unproven reserves or in “wildcat” areas.

The Granting Clause

The opening paragraph of most leases is the granting clause. It will outline the purpose of the lease and describe the substances that can be explored and produced. Typically, limit it to: exploring, drilling, mining and producing oil and gas and all other associated hydrocarbons in whatsoever nature or kind. The more liberal leases state the agreement covers all other minerals and other gases and their respective vapors. Landowners should be hesitant about signing the more liberal type lease. Their concern should be with the royalty percentage share that is allocated to the other minerals. For example, landowners should expect a greater royalty from the production of uranium or helium than from carbon dioxide or sulfur. If the lease is silent on this matter, a landowner will receive the same royalty for all minerals that are produced.

As possible alternatives, landowners should enumerate the minerals covered by the lease to the exclusion of all other, e.g., all petroleum and natural gas and related hydrocarbons and no other minerals or substances in any form. Alternatively, landowners may amend the royalty clause to denote explicitly the percentage share they will receive for the production of any substances likely to be found in commercial quantities. Finally, the Lessor may consider inserting an arbitration clause to ascertain the royalty for substances other than oil, gas, and associated hydrocarbons that may be discovered.

To insure that site reclamation is done, Lessor can require a performance bond from lessee. This prevents Lessor from having to do reclamation if Lessee’s company goes out of business.

The Granting Clause

1. Most leases grant the unrestricted right to construct permanent facilities such as power stations, storage tanks, or employees’ quarters and a unrestricted right for the surface or injection disposal of salt water. Alternatively, the lease can state that the prior written consent of the Lessor is needed for both the construction and location of such structures and sites.

2. Alternatively, attach a map of the proposed lease area specifying where roads, pipelines, telephone lines, salt water disposal sites and even wells may be located. For convenience sake, landowners generally do not permit wells within 200 feet (or some other stipulated distance) of a dwelling. Further, provide that all underground transmission devices such as pipelines must be buried at a 48” depth, not below “plow depth” in agricultural areas. If deviations are necessary, permit them only after securing the Lessor’s written consent.

3. Landowners wishing to cultivate or graze the area immediately above any pipelines can direct the lessee to use the double ditch method for laying pipe. This method requires the
top soil be placed on one side of the trench and the subsoil on the other. When backfilling, the subsoil is replaced first followed by the top soil.

4. Specify whether the lessee’s structures and equipment must be removed at the expiration of the lease or be forfeited.

5. Identify the parties liable for the construction and maintenance of fences, gates, or similar structures around the premises, pits, drilling sites, and above intersecting pipelines. The precise dimensions and characteristics of these retention devices may need to be included to prevent the erection of inadequate fences and gates.

Surface Operations and Surface Damage Agreement

With few exceptions, the grant of an oil and gas lease carries with it the implied right to use as much of the surface area as is reasonably necessary to explore and produce the oil and gas. Oil companies generally desire a much broader usage of the surface area. Consequently, most leases contain provisions permitting a wide range of surface activities.

Even though the lessee may be liable for surface damages, the inconvenience of unwanted and unwarranted structures and entries upon the surface area by the lessee may be avoided to some degree by the following:

The State of Michigan lease requires a “Surface Use Agreement for Well Site”. This is a separate agreement that is an addendum to the lease and occurs when drilling is planned but before commencing. It encourages Lessee to limit surface disturbance and requires that a well not be drilled until the agreement is signed. The Lessee will be required to make payment for all damages to surface including loss of use of damaged surface, so reducing surface damage is to his benefit also. The agreement is used to locate roads, flow lines and other equipment to minimize disturbance. The lease can state: “No operations shall be conducted by the Lessee until a separate Surface Use Agreement is agreed to and signed by Lessor and Lessee.”

This Surface Use Agreement can require lessee to:

1. Provide a proposed development plan and map that shows proposed access route, location of well, separator, tanks, any existing pipelines and proposed flow lines or pipelines to be installed.

2. Require compensation for ALL surface damages including the lost usage of the land required for the roads, drilling pad, oil storage tanks, separators and other equipment. This is usually a one-time upfront payment.

3. Require restoration of exposed areas and if possible, require the lessee to restore the land to its condition prior to any operations.

4. Lessor input and agreement on restoration plan to reduce impact on surface uses.

5. Install fence around drilling site. Keeps cattle away from mud pits.

6. Describe the method or methods to be employed for determining the extent of damages suffered. In the event the parties cannot agree, provide for arbitration or some other means of resolving the dispute.
7. Describe the items for which the lessee will be liable – e.g., injuries to growing crops, pastures, erosion and stagnation of the soil, growing timber, livestock, fences, ditches, canals, buildings and other structures, or the pollution of any waters.

8. Designate the time period by which all claims or notices must be submitted to the lessee.

9. Whether or not gates are required at road entrances to prevent trespassing

10. Can require a performance bond or advance payment from lessee to guarantee that restoration takes place

11. Whenever someone enters into an agricultural lease or purchases surface rights to land void of any mineral interests, he or she should always enter a contract with the owners of the mineral interests stating that a surface damage clause will be included in any mineral lease that is entered. This will insure the lessee or purchaser that any damages to crops, pasture or surface will be compensated.

The Surface Use Agreement provides the opportunity for better communication, encourages the limitation of surface damages and can prevent unexpected problems arising from assumptions about operational activities by either side. It provides a mechanism for each side to know exactly what will be happening and when on the lease.

If the proposed development area includes timber, the timber can be appraised using a consulting forester and sell by bid to insured logger where well sites, rights of way, etc. will be.

**The Duration of the Lease**

Leases are divided into two separate time periods. The first period, or primary term is a set number of years negotiated by the parties during which the lessee must commence drilling operations or pay an annual fee to the Lessor. The shorter the primary term the better, for example 2 or 3 years. The lease will generally state that if drilling operations are not commenced during the primary term, the lease will terminate unless an agreed sum is paid the Lessor called the delay rental. Extensions after primary term constitute secondary term. You can charge “ramp-up” delay rentals. For example, the first year can be the same rate as the original bonus, the second year can be that rate plus $10 per acre, etc. Delay rentals constitute the secondary term. Delay rentals must be paid on each subsequent anniversary date of the lease’s primary term if drilling operations have not yet begun by that date.

Failure to receive the delay rental payment by the stipulated time automatically terminates the lease whenever the word “unless” is used in the lease to indicate the necessity of tendering the payment. Some leases contain the word “or” rather than “unless.” In the former case the lease will not terminate.

If production is not established by the end of the primary term, the lease will end. If production has been established, the lease will continue into its secondary term and last so long as substances covered by the lease continue to be produced. Generally the full clause will read, “This lease shall remain in force and effect for a term of ------ years (or months) and as long thereafter as substances covered by the lease are produced.”
For the best protection, the Lessor should consider one or more of the following recommendations:

1. Strive to keep the primary term as short as possible. This should force earlier explorations.
2. If the primary term cannot be shortened, strive to negotiate a higher annual delay rental payment.
3. Make sure the word “unless” is employed in conjunction with delay rentals. Keep a watchful eye on the date by which the delay rental payments must be received. Acceptance of a late payment may be construed as ratification and the lease will not terminate.
4. Stipulate that the lessee must identify the governing lease and the provisions necessitating any payments made to the Lessor. This is an invaluable aid for landowners trying to keep track of several different leases on their land.

Extension of the Primary and Secondary Terms

The primary and sometimes the secondary terms of the lease may be extended contractually via shut-in provisions, dry-hole provisions or cessation-of-production provisions. Most leases will contain all three.

Shut-in provisions allow the lease to remain in effect (sometimes during both the primary and secondary terms) whenever gas from a producing well is not, for some reason, being sold or used by the lessee. In other words, a well that is shut-in is still classified as a producing well under the lease provisions and the lease will not terminate. However, a shut-in royalty (or some other stipulated sum generally approximating the value of the delay rental payment) must be paid annually to keep the lease in effect.

Dry-hole provisions, on the other hand, can only extend the primary term of the lease. Basically the lease will provide that if oil or gas has not been discovered when a dry-hole is struck, the lease will not terminate even though the primary term has expired if, in the interim the lessee renews drilling or re-working operations within 60 days (or some other specified period) thereafter. In the event the primary term has not expired and more than fourteen months still remain, the lessee has two other options available. He can either pay the next delay rental payment, which comes due more than 60 days after the dry hole was discovered or commence drilling or re-working operations on or before the same date. If less than fourteen months remain in the primary term when the dry hole is discovered, the lease will continue in force to the end of the primary term even though the lessee operations remain idle and no delay rentals are paid.

Cessation-of-production provisions correspond quite closely to the dry-hole provisions, but apply only after oil or gas has been discovered. If oil and gas production should cease for any reason, the lease will not terminate if the lessee again follows one of the three options described in the dry-hole provisions. In this instance, though, there are no exceptions accorded under the fourteen-month rule.
It is quite possible for the primary term to be extended indefinitely via the dry-hole provisions. If the lessee has not discovered oil or gas and is in the process of drilling or re-working operations when the primary term expires, the lease will continue in force for so long as the lessee faithfully renews drilling or re-working operations within 60 days after striking each dry hole. However, if a producing well should subsequently be discovered and its production later ceases, the lessee must strike another producing well stemming from operations commencing within 60 days thereafter or the lease will expire. The discovery of a subsequent dry hole will terminate the lease according to its terms.

Most landowners have little quarrel with dry-hole and cessation-of-production provisions since in both cases oil and gas are being diligently sought. However, landowners may question the shut-in provisions, especially where no apparent reason for the harboring of gas (or possibly oil) exists.

While shut-in provisions may not be used as extensively as in the past, landowners should be aware of the following alternatives that clarify its possible usage.

1. Shut-in royalties can be required during both the primary and secondary terms of the lease.
2. A time limit can be placed on the shut-in clause – no more than three years or three years beyond the primary term.
3. To provide more incentive for the lessee to explore, escalate the shut-in royalty for each year the gas or oil is shut in.
4. As an alternative, permit the shut-in clause to continue after a stated period but only for a given number of acres immediately surrounding the well—e.g., 40 acres. The rest of the leased area will revert back to the Lessor-landowner. (This provision may be qualified depending on the reasons for the shut-in).
5. Specify the circumstances when the shut-in clause may be involved—e.g., for lack of market, available pipeline, or government restrictions, or permit the shut-in only when, in the lessee’s good faith judgment, it is economically inadvisable to produce and sell for the time being.
6. Automatically terminate the shut-in provision whenever a well, located on adjacent land, situated within a certain number of feet of the leased premises, and completed within the same producing reservoir, begins producing and selling gas in marketable quantities.

The Royalty Clause

Each lease contains a royalty clause that allocates to the landowner a certain portion of the substances produced. The state of Michigan receives 1/6. Royalties of 3/16 to even 20% is not unheard of in private industry, depending on the situation. Economically, it is probably the most important clause to the landowner. Terms of royalty clauses vary greatly from lease to lease. Consequently, this clause should receive close scrutiny by landowners. Here are some potential problems to guard against.
First, determine which costs, if any, can be deducted from the landowner’s royalty payment. Specify the royalty be established at the well, (not the pipeline) and free of production and marketing costs. The goal should be for the production company to bear all exploration, production and marketing costs. Royalties should be paid on oil, gas and condensate produced through the well bore. Make it clear that the Lessor is not charged for gathering, compression, transportation, treatment and dehydration expenses before royalty calculated.

Generally all expenses encountered up through the production stages are borne solely by the oil company unless the lease states otherwise. Expenses encountered subsequent to production can be either shared or borne solely by the oil company depending on the terms of the lease.

The shared expenses will depend partly upon where the lease fixes the royalty. If the lease is silent on this matter, the royalty is impliedly ascertained “at the well.” In such cases, the landowner’s royalty payment is free of production costs but bears a proportionate share of certain costs incurred subsequent thereto. If the lease fixes the royalty “in the pipeline,” “at the place of sale” or at other delivery points, a different set of costs subsequent to production will be shared but there is no uniformity among the states on this point. These subsequent costs may include such items as compression expenses necessary to make the product deliverable into the purchaser’s pipeline, expenses necessary to make the product salable, the expenses used in measuring production, and even transportation costs. The state of Michigan lease reads: “It is agreed that the Lessee is required to place lease products in marketable condition at no cost to the Lessor. The value of gross proceeds shall be increased to the extent that the gross proceeds have been reduced because the purchaser, or any other person, is providing certain services the cost of which is the responsibility of the Lessee to place lease products in marketable condition.”

Another problem which the landowner should consider is determining how the royalty payment is valued or received. Three methods generally are used.

The first method is based on the market price or value of the mineral, generally at the mouth of the well. In the past, if there was no market at the well, then the market price prevailing in the field was used. And if there was no field market, then the value was determined by sales of marketing outlets. Finally, if there were no comparable sales, the actual or intrinsic value of the substance could be used.

The market price method has been quite popular with landowners because it allows the royalty to follow the recent upward price trend for oil and gas. However, sometimes the prices posted at wells or fields are discriminatorily or artificially set and hence substantially less than the prices paid for comparable oil and gas at other locations. In such cases, it may be possible to get a higher valuation for the royalty payments but only after a difficult burden of proof has been met by the landowner in a judicial proceeding. To avoid such problems, always try inserting some formula for determining how the market price or value will be established. For example, some leases read, “at the highest price (or percentage thereof) posted for a field within 100 miles by any of the seven major oil companies for like grade and gravity on the day the oil is removed.”

The second method of evaluating royalty payments is by way of “proceeds.” This method ties the value of the royalty to the actual revenue (or sales price) received from the sale of the
mineral. As such, the resulting returns may or may not equal the mineral’s actual market value as discussed earlier. In the past, royalties based on proceeds were very popular. This method gave greater flexibility to the producer in marketing the product, particularly gas. By committing gas to long-term contracts, the producer could insure the landowner of a constant, dependable royalty income over time. The disadvantage was that the resulting proceeds were not immediately sensitive to a rising market price.

The third method of receiving a royalty is “in kind.” This method allows the landowner to take actual possession of his share of the mineral’s production before it is ever marketed by the producer. It presents an excellent alternative for dealing with a lease based on “proceeds.” By inserting an option to take royalties either “in proceeds” or “in kind,” the landowner can get the best of both worlds. Whenever the market price rises above any long-term commitment price, the landowner can take his or her share “in kind” and seek a more lucrative market outlet. Whenever the market price falls below any long-term commitment, the Lessor’s share can be taken in proceeds. As a general rule, lessees are hesitant about granting an in-kind/in-proceeds option unless the lease is in a major producing field. Otherwise, the cost of the storage, accounting, delivery and other associated expenses may prove to be economically unfeasible.

The following is a list of factors that also might be considered when negotiating a royalty clause.

1. Detail the time, place and frequency royalty payments are to be tendered. Outline the consequences for royalty payments being missed. Consider charging late fees and interest if the timing is not met.
2. Discuss and resolve whether royalties must be paid for wastes due to leakage, fire, or other reasons that can be attributed to the lessee’s negligence.
3. Reserve the option to take “in kind” if feasible.
4. Consider an extra royalty (or overriding royalty) based on a sliding scale with any one of several items as variables. For example, have one royalty based on daily or monthly production of less than (x) barrels per day (or month) and another whenever production exceeds this level. Other variables upon which the scale could be based include whether the substance is free flowing or whether it must be lifted by artificial means, the price of crude oil in the event domestic price controls are eliminated, or the lessee’s recoupment of all or a certain percentage of the production cost from the well.
5. Determine if and when the landowner should have access to free gas. Many leases allow the Lessor the free usage of gas for domestic (and sometimes agricultural) purposes.
6. By the same token, decide whether the lessee should have free use of water, oil or gas produced on the leased premises.
7. As mentioned in prior sections, do not forget to include any differing royalty percentages for substances other than oil and gas that might be discovered if the landowner should choose that alternative.
8. Always state the exact costs encountered subsequent to production that may be shared regardless of whether the royalty is fixed “at the well,” “in the pipeline,” or “at the place of sale.” Ideally, negotiate a clause that requires no costs subsequent to production to be borne by the Lessor.
Pooling

Most leases will contain some provision giving the lessee the right to consolidate the leased premises with adjoining leased tracts. The area thus formed is called a “pool” or sometimes a “unit.” The rationale for establishing such pools is to unite under one operator all the landowners having an interest in a common underground reservoir. By doing so, the lessee avoids unnecessary drilling, protects the rights of the landowners in the common reservoir and prevents waste. Sometimes pooling arrangements are necessary to meet the minimum acreage requirement for a drilling permit under state regulations.

In most states, landowners may be subjected to two types of pooling arrangements. One is voluntary; the other is compulsory or statutory. The voluntary arrangement requires the free consent of the landowner and is generally found in the context of most lease forms. The statutory arrangement, on the other hand, is mandatory whenever the specified requirements under relevant state law have been satisfied. By entering either type of pooling arrangement, the landowner may find the interpretation and application of the lease provisions materially altered.

Obviously, the landowner can do little to avoid compulsory or statutory pooling. The landowner, however, may find it advisable to exercise caution in granting the lessee the unrestricted right to pool the leased premises. The following suggestions may be helpful in this regard.

1. Submit to voluntary pooling in the lease only to the extent necessary to get a drilling permit from the state. Otherwise, the landowner’s written consent should be required to pool. Do not consent until the landowner understands the full impact of the pooling arrangement on the lease terms, the full description of the proposed pool area and the details on how the boundaries were determined.

2. In order to keep a pool from being overly extensive, stipulate in the lease the maximum number of acres a pool may contain. As a rule of thumb, limit the acreage to no more than that specified in a statutory or compulsory pool in your state.

3. Give some thought as to whether the lessee may alter or change the size or shape of the proposed pool after the landowner has consented.

4. Consider whether the pool is limited to certain producing strata or given for any and all producing formations which may be encountered. Also consider which substances may be pooled – e.g., oil and gas but not other gaseous substances, coal or valuable stones.

5. In all cases, try to negotiate the inclusion of a “Pugh” clause in the lease that provides for the severance of the lease into separate tracts whenever less than all of the premises are included in a single pool or unit. A typical Pugh clause will read, “Upon the pooling of less than all of the leased land, this lease shall be severed and considered as separate and distinct leases. The lease term and all the rights and obligations of the lessee under this instrument shall apply separately to the pooled and unpooled acreage.” Without a Pugh clause, leases generally have language which extends the “leased premises” to all areas pooled with the original tract. Thereafter, if production, drilling or re-working operations are commenced on any portion of the pool (whether on the original leased tract or not), they will be construed as being undertaken on the leased land. By thus including a small area of a larger lease tract in a pool, the lessee can effectively eliminate the need for
tendering delay rentals, reduce the proportionate share of royalties to the respective landowners, and still maintain the full lease by drilling and possibly establishing production on any part of the pooled area.

6. If possible require all pooling to occur prior to drilling operations and not afterwards.

**Assignment Clause**

Typically leases contain a provision permitting both the Lessor and the lessee the unrestricted privilege of assigning their rights under the lease. To a large extent these provisions are for the lessee’s benefit.

A customary practice in the oil and gas industry is for independent landmen to lease a large area and assign (sell) it to an oil company. Consequently, the ultimate developer-producer may not be the original lessee-negotiator. At times the landowner may find the original lease tract being subdivided among several before-unknown developers. To keep better apprised of such changes, the landowner may seek to incorporate some of the following suggestions.

1. Deny the right of assignment without first securing the landowner’s written consent. If this is not feasible, state that any assignment is not binding upon the Lessor until he or she is duly notified in writing. The landowner should keep a record of each new assignee for his or her permanent files.

2. Do not release the original lessee from liability for a default on any assigned portion of the lease or leased area. Stipulate that a default on any assigned part of the lease is a default on the whole.

3. Provide that an identification of the governing lease (or assignment thereof) must accompany each payment.

**Warranty Clause**

Leases generally will contain a warranty clause binding the landowners to defend their interest in, or title to, the leased premises should a dispute ever arise over ownership. To avoid any possible litigation expenses, landowners should seek to delete such language. Since most oil companies or landmen generally conduct preliminary investigations as to the ownership of the mineral interest prior to any lease negotiations, the warranty clause should not be needed anyway. During negotiations, ask to receive a copy of the title search work held by the potential lessee. This gives you the chain of title and documents when or if mineral rights were reserved.

**Lessee’s Right to Free Water, Oil and Gas**

Landowners should pay close attention to any provisions in a lease providing free water, oil or gas to the producer for operations. Particularly in areas where water is scarce, certain limitations should be placed on these rights. The following suggestions may be helpful.

1. Decide whether free water, oil or gas privileges will be granted to the lessee. If so, stipulate whether the substances may be used for operations conducted both on and off
the leased premises. (These provisions may be incorporated into the royalty clause as mentioned earlier.)

2. Do not allow the lessee to take water from wells, tanks, ponds or reservoirs.

3. If recovery measures are undertaken by the lessee involving floodwater operations, deny the use of potable water. State that such water must come from non-fresh sources.

4. If water is to be purchased, state how the market price will be determined.

**Other Factors for the Landowner’s Consideration**

Without going into detail, the following factors may be considered by landowners when negotiating a lease.

1. If the land contains several producing formations at varying depths, lease each strata independently.

2. Always note in the lease whether the land can be used for underground storage of gas, oil or brine. Be very careful if a request is made to use a well to inject brine water. This is not recommended.

3. Always insert provisions allowing free access to books, records, and drilling data accumulated pursuant to operations conducted on the landowner’s premises.

4. If possible, negotiate some provisions whereby the landowner may assume control of the casing in the borehole when operations are abandoned. The casing can then be used to withdraw any remaining gas or extract fresh water for domestic or agricultural purposes.

5. Provide that if the lessee does not rectify any breach of a covenant contained in the lease within 30 days after Lessor gives written notice, the lessee should pay reasonable attorney fees and reasonable investigative costs incurred by Lessor in preparing Lessor’s case for trial.

6. Require lessee to indemnify, save and hold Lessor harmless from all claims, demands and causes of action stemming from activities undertaken by lessee or lessee’s assignees, their employees, agents, contractors and subcontractors, during operations conducted on the leased premises. As an alternative, require the lessee to post bond and carry comprehensive liability insurance of a specified amount as added security from such claims.

**Summary**

Negotiating an oil and gas lease requires legal knowledge, foresight and common sense. No landowner could possibly hope to have all these suggestions included in a lease. The number successfully incorporated depends largely upon negotiating power. Negotiation of an equitable lease requires the assistance of an experienced oil and gas attorney. It is not advisable to sign a lease if your understanding of the provisions is not clear. If satisfactory terms or compensation are not provided in the contact, new or additional terms should be negotiated or the contract should not be signed. The attorney can assist a landowner in understanding the lease language and negotiating terms favorable for the landowner.
