ON SENSE AND REFERENCE

Gottlob Frege

Identity gives rise to challenging questions which are not altogether easy to answer. Is it a relation? A relation between objects, or between names or signs of objects? In my Begriffsschrift I assumed the latter. The reasons which seem to favor this are the following: $a = a$ and $a = b$ are obviously statements of differing cognitive value; $a = a$ holds a priori and, according to Kant, is to be labeled analytic, while statements of the form $a = b$ often contain very valuable extensions of our knowledge and cannot always be established a priori. The discovery that the rising sun is not new every morning, but always the same, was of very great consequence to astronomy. Even today the identification of a small planet or a comet is not always a matter of course. Now if we were to regard identity as a relation between which the names “$a$” and “$b$” designate, it would seem that $a = b$ could not differ from $a = a$ (i.e., provided $a = b$ is true). A relation would thereby be expressed of a thing to itself, and indeed one in which each thing stands to itself but to no other thing. What is intended to be said by $a = b$ seems to be that the signs or names “$a$” and “$b$” designate the same thing, so that those signs themselves would be under discussion; a relation between them would be asserted. But this relation would hold between the names or signs only insofar as they named or designated something. It would be mediated by the connection of each of the two signs with the same designated thing. But this is arbitrary. Nobody can be forbidden to use any arbitrarily producible event or object as a sign for something. In that case the sentence $a = b$ would no longer refer to the subject matter, but only to its mode of designation; we would express no proper knowledge by its means. But in many cases this is just what we want to do. If the sign “$a$” is distinguished from the sign “$b$” only as object (here, by means of its shape), not as sign (i.e., not by the manner in which it designates something), the cognitive value of $a = a$ becomes essentially equal to that of $a = b$, provided $a = b$ is true. A difference can arise only if the difference between the signs corresponds to a difference in the mode of presentation of that which is designated. Let $a$, $b$, $c$ be the lines connecting the vertices of a triangle with the midpoints of the opposite sides. The point of intersection of $a$ and $b$ is then the same as the point of intersection of $b$ and $c$. So we have different designations for the same point, and these names (“Point of intersection of $a$ and $b$,” “Point of intersection of $b$ and $c$”) likewise indicate the mode of presentation; and hence the statement contains true knowledge.

It is natural, now, to think of there being connected with a sign (name, combination of words, letter), besides that to which the sign refers, which may be called the referent of the sign, also what I would like to call the sense of the sign.

1 I use this word strictly and understand “$a = b$” to have the sense of “$a$ is the same as $b$” or “$a$ and $b$ coincide.”

2 The reference is to Frege's Begriffsschrift, eine der arithmetischen nachgebildete Formelsprache des reinen Denkens (Halle, 1879).

wherein the mode of presentation is contained. In our example, accordingly, the referents of the expressions “the point of intersection of $a$ and $b$” and “the point of intersection of $b$ and $c$” would be the same, but not their senses. The referent of “evening star” would be the same as that of “morning star,” but not the sense.

It is clear from the context that by “sign” and “name” I have here understood any designation representing a proper name, whose referent is thus a definite object (this word taken in the widest range), but no concept and no relation, which shall be discussed further in another article.8 The designation of a single object can also consist of several words or other signs. For brevity, let every such designation be called a proper name.

The sense of a proper name is grasped by everybody who is sufficiently familiar with the language or totality of designations to which it belongs;1 but this serves to illustrate only a single aspect of the referent, supposing it to exist. Comprehensive knowledge of the referent would require us to be able to say immediately whether every given sense belongs to it. To such knowledge we never attain.

The regular connection between a sign, its sense, and its referent is of such a kind that to the sign there corresponds a definite sense and to that in turn a definite referent, while to a given referent (an object) there does not belong only a single sign. The same sense has different expressions in different languages or even in the same language. To be sure, exceptions to this regular behavior occur. To every expression belonging to a complete totality of signs, there should certainly correspond a definite sense; but natural languages often do not satisfy this condition, and one must be content if the same word has the same sense in the same context. It may perhaps be granted that every grammatically well-formed expression representing a proper name always has a sense. But this is not to say that to the sense there also corresponds a referent. The words “the celestial body most distant from the earth” have a sense, but it is very doubtful if they also have a referent. The expression “the least rapidly convergent series” has a sense; but it is known to have no referent, since for every given convergent series, another convergent, but less rapidly convergent, series can be found. In grasping a sense, one is not certainly assured of a referent.

As: If words are used in the ordinary way, one intends to speak of their referents. It can also happen, however, that one wishes to talk about the words themselves or their sense. This happens, for instance, when the words of another are quoted. One's own words then first designate words of the other speaker, and only the latter have

See his “Über Begriff und Gegenstand” in Vierteljahrsschrift für wissenschaftliche Philosophie (1892), 193-205.

In the case of an actual proper name such as “Aristotle” opinions as to the sense may differ. It is possible, for instance, be taken to be the following: the pupil of Plato and teacher of Alexander the Great. Anybody who does this will attach another sense to the sentence “Aristotle was born in Stagira” than will a man who takes as the sense of the name: the teacher of Alexander the Great who was born in Stagira. So long as the referent remains the same, such variations may be tolerated, although they are to be avoided in the theoretical structure of a deductive science and ought not to occur in a complete language.
their usual referents. We then have signs of signs. In writing, the words are in this
case enclosed in quotation marks. Accordingly, a word standing between quotation
marks must not be taken as having its ordinary referent.

In order to speak of the sense of an expression "A" one may simply use the
phrase "the sense of the expression A." In reported speech one talks about the
sense—e.g., of another person's remarks. It is quite clear that in this way of speaking
words do not have their customary referents but designate what is usually their
sense. In order to have a short expression, we will say: In reported speech,
words are used indirectly or have their indirect referents. We distinguish accordingly
the customary from the indirect referent of a word; and its customary sense
from its indirect sense. The indirect referent of a word is accordingly its customary
sense. Such exceptions must always be borne in mind if the mode of connection
between sign, sense, and referent in particular cases is to be correctly understood.

The referent and sense of a sign are to be distinguished from the associated
conception. If the referent of a sign is an object perceivable by the senses, my
conception of it is an internal image, arising from memories of sense impressions
which I have had and activities, both internal and external, which I have per-
formed. Such a conception is often saturated with feeling; the clarity of its separ-
ate parts varies and oscillates. The same sense is not always connected, even in
the same man, with the same conception. The conception is subjective: One man's
conception is not that of another. There result, as a matter of course, a variety of
differences in the conceptions associated with the same sense. A painter, a horse-
man, and a zoologist will probably connect different conceptions with the name
"Bucephalus." This constitutes an essential distinction between the conception
and the sign's sense, which may be the common property of many and therefore
is not a part or a mode of the individual mind. For one can hardly deny that
mankind has a common store of thoughts which is transmitted from one genera-
tion to another.¹

In the light of this, one need have no scruples in speaking simply of the sense,
whereas in the case of a conception one must precisely indicate to whom it
belongs and at what time. It might perhaps be said: Just as one man connects this
conception and another that conception with the same word, so also one man can
associate this sense and another that sense. But there still remains a difference in
the mode of connection. They are not prevented from grasping the same sense;
but they cannot have the same conception. Si duo idem factunt, non est idem.

If two persons conceive the same, each still has his own conception. It is
indeed sometimes possible to establish differences in the conceptions, or even in

³ We can include with the conceptions the direct experiences in which sense-impressions and
activities themselves take the place of the traces which they have left in the mind. The distinction
is unimportant for our purpose, especially since memories of sense-impressions and activities
always help to complete the conceptual image. One can also understand direct experience as
including any object, in so far as it is sensibly perceptible or spatial.

⁴ Hence it is inadvisable to use the word "conception" to designate something so basically
different.

the sensations, of different men; but an exact comparison is not possible, because
we cannot have both conceptions together in the same consciousness.

The referent of a proper name is the object itself which we designate by its
means; the conception, which we thereby have, is wholly subjective; in between
lies the sense; which is indeed no longer subjective like the conception, but is yet
not the object itself. The following analogy will perhaps clarify these relationships.
Somebody observes the moon through a telescope. I compare the moon itself to
the referent; it is the object of the observation, mediated by the real image projec-
ted by the object glass in the interior of the telescope, and by the retinal image
of the observer. The former I compare to the sense, the latter to the conception
or experience. The optical image in the telescope is indeed one-sided and dependent
upon the standpoint of observation; but it is still objective, inasmuch as it can be
used by several observers. At any rate it could be arranged for several to use it
simultaneously. But each one would have his own retinal image. On account of the
diverse shapes of the observers' eyes, even a geometrical congruence could hardly
be achieved, and a true coincidence would be out of the question. This analogy
might be developed still further, by assuming As retinal image made visible to B;
or A might also see his own retinal image in a mirror. In this way we might per-
haps show how a conception can itself be taken as an object, but as such is not for
the observer what it directly is for the person having the conception. But to pur-
sue this would take us too far afield.

We can now recognize three levels of difference between words, expressions,
or whole sentences: The difference may concern at most the conceptions, or the
sense but not the referent; or, finally, the referent as well. With respect to the first
level, it is to be noted that, on account of the uncertain connection of conceptions
with words, a difference may hold for one person, which another does not find.
The difference between a translation and the original text should properly not
overstep the first level. To the possible differences here belong also the coloring
and shading which poetic eloquence seeks to give to the sense. Such coloring and
shading are not objective, and must be evoked by each hearer or reader according
to the hints of the poet or the speaker. Without some affinity in human concep-
tions art would certainly be impossible; but it can never be exactly determined
how far the intentions of the poet are realized.

In what follows there will be no further discussion of conceptions and
experiences; they have been mentioned here only to ensure that the conception
aroused in the hearer by a word shall not be confused with its sense or its referent.

To make short and exact expressions possible, let the following phraseology
be established:

A proper name (word, sign, sign combination, expression) expresses its sense,
refers to or designates its referent. By means of a sign we express its sense and
designate its referent.

Idealists or skeptics will perhaps long since have objected: "You talk, without
further ado, of the moon as an object; but how do you know that the name 'the moon'
has any referent? How do you know that anything whatsoever has a referent?" I
reply that when we say "the moon," we do not intend to speak of our conception
of the moon, nor are we satisfied with the sense alone, but we presuppose a referent. To assume that in the sentence "The moon is smaller than the earth" the conception of the moon is in question, would be flatly to misunderstand the sense. If this is what the speaker wanted, he would use the phrase "my conception of the moon." Now we can of course be mistaken in the presupposition, and such mistakes have indeed occurred. But the question whether the presupposition is perhaps always mistaken need not be answered here; in order to justify mention of the referent of a sign it is enough, at first, to point out our intention in speaking or thinking. (We must then add the reservation: provided such a referent exists.)

So far we have considered the sense and referents only of such expressions, words, or signs as we have called proper names. We now inquire concerning the sense and referent of an entire declarative sentence. Such a sentence contains a thought. Is this thought, now, to be regarded as its sense or its referent? Let us assume for the time being that the sentence has a referent! If we now replace one word of the sentence by another having the same referent, but a different sense, this can have no influence upon the referent of the sentence. Yet we can see that in such a case the thought changes; since, e.g., the thought of the sentence "The morning star is a body illuminated by the sun" differs from that of the sentence "The evening star is a body illuminated by the sun." Anybody who did not know that the evening star is the morning star might hold the thought to be true, the other false. The thought, accordingly, cannot be the referent of the sentence, but must rather be considered as the sense. What is the position now with regard to the referent? Have we a right even to inquire about it? Is it possible that a sentence as a whole has only a sense, but no referent? At any rate, one might expect that such sentences occur, just as there are parts of sentences having sense but no referent. And sentences which contain proper names without referents will be of this kind. The sentence "Odysseus was set ashore at Ithaca while sound asleep" obviously has a sense. But since it is doubtful whether the name "Odysseus," occurring therein, has a referent, it is also doubtful whether the whole sentence has one. Yet it is certain, nevertheless, that anyone who seriously took the sentence to be true or false would ascribe to the name "Odysseus" a referent, not merely a sense; for it is the referent of the name which is held to be or not to be characterized by the predicate. Whoever does not consider the referent to exist, can neither apply nor withhold the predicate. But in that case it would be superfluous to advance to the referent of the name; one could be satisfied with the sense, if one wanted to go no further than the thought. If it were a question only of the sense of the sentence, the thought, it would be unnecessary to bother with the referent of a part of the sentence; only the sense, not the referent, of the part is relevant to the sense of the whole sentence. The thought remains the same whether "Odysseus" has a referent or not. The fact that we concern ourselves at all about the referent of a part of the sentence indicates that we generally recognize

---

5 By a thought I understand not the subjective performance of thinking but its objective content, which is capable of being the common property of several thinkers.

6 It would be desirable to have a special term for signs having only sense. If we name them, say, representations, the words of the actors on the stage would be representations; indeed the actor himself would be a representation.

7 A judgment, for me, is not the mere comprehension of a thought, but the recognition of its truth.
prime number." It follows that the relation of the thought to the true may not be compared with that of subject to predicate. Subject and predicate (understood in the logical sense) are indeed elements of thought; they stand on the same level for knowledge. By combining subject and predicate, one reaches only a thought, never passes from a sense to its referent, never from a thought to its truth value. One moves at the same level but never advances from one level to the next. A truth value cannot be a part of a thought, any more than say the sun can, for it is not a sense but an object.

If our supposition that the referent of a sentence is its truth value is correct, the latter must remain unchanged when a part of the sentence is replaced by an expression having the same referent. And this is in fact the case. Leibniz explains: "Badem sunt, quae ab ibi nutritio sustituit, salva veritate." What else but the truth value could be found, that belongs quite generally to every sentence concerned with the referents of its components and remains unchanged by substitution of the kind in question?

If now the truth value of a sentence is its referent, then on the one hand all true sentences have the same referent and so, on the other hand, do all false sentences. From this we see that in the referent of the sentence all that is specific is obliterated. We can never be concerned only with the referent of a sentence; but again the mere thought alone yields no knowledge, but only the thought together with its referent, i.e., its truth value. Judgments can be regarded as advances from a thought to a truth value. Naturally this cannot be a definition. Judgment is something quite peculiar and incomparable. One might also say that judgments are distinctions of parts within truth values. Such distinction occurs by a return to the thought. To every sense belonging to a truth value there would correspond its own manner of analysis. However, I have here used the word "part" in a special sense. I have in fact transferred the relation between the parts and the whole of the sentence to its referent, by calling the referent of a word part of the referent of the sentence, if the word itself is a part of the sentence. This way of speaking can certainly be attacked, because in the case of a referent the whole and one part do not suffice to determine the remainder, and because the word part is already used in another sense of bodies. A special term would need to be invented.

The supposition that the truth value of a sentence is its referent shall now be put to further test. We have found that the truth value of a sentence remains unchanged when an expression is replaced by another having the same referent: But we have not yet considered the case in which the expression to be replaced is itself a sentence. Now if our view is correct, the truth value of a sentence containing another as part must remain unchanged when the part is replaced by another sentence having the same truth value. Exceptions are to be expected when the whole sentence or its part is direct or indirect quotation; for in such cases, as we have seen, the words do not have their customary referents. In direct quotation, a sentence designates another sentence, and in indirect quotation a thought.

We are thus led to consider subordinate sentences or clauses. These occur as parts of a sentence structure, which is, from the logical standpoint, likewise a sentence. But here we meet the question whether it is also true of the subordinate sentence that its referent is a truth value. Of indirect quotation we already know the opposite. Grammarians view subordinate clauses as representatives of parts of sentences and divide them accordingly into noun clauses, adjective clauses, adverbial clauses. This might generate the supposition that the referent of a subordinate clause was not a truth value but rather of the same kind as the referent of a noun or adjective or adverb—in short, of a part of a sentence, whose sense was not a thought but only a part of a thought. Only a thorough investigation can clarify the issue. In so doing, we shall not follow the grammatical categories strictly, but rather group together what is logically of the same kind. Let us first search for cases in which the sense of the subordinate clause, as we have just supposed, is not an independent thought.

The case of an abstract noun clause, introduced by "that," includes the case of indirect quotation, in which we have seen the words to have their indirect referents coinciding with what is customarily their sense. In this case, then, the subordinate clause has for its referent a thought, not a truth value; as sense not a thought, but the sense of the words "the thought, that . . ." which is only a part of the thought of the entire complex sentence. This happens after "say," "hear," "be of the opinion," "be convinced," "conclude," and similar words. Otherwise, and indeed somewhat complicated, is the situation after words like "perceive," "know," "fancy" which are to be considered later.

That in the cases of the first kind the referent of the subordinate clause is in fact the thought can also be recognized by seeing that it is indifferent to the truth of the whole whether the subordinate clause is true or false. Let us compare, for instance, the two sentences "Copernicus believed that the planetary orbits are circles" and "Copernicus believes that the apparent motion of the sun is produced by the real motion of the earth." One subordinate clause can be substituted for the other without harm to the truth. The main clause and the subordinate clause together have as their sense only a single thought, and the truth of the whole includes neither the truth nor the untruth of the subordinate clause. In such cases it is not permissible to replace one expression in the subordinate clause by another having the same customary referent, but only by one having the same indirect referent, i.e., the same customary sense. If somebody were to conclude: The referent of a sentence is not its truth value, "For then it could always be replaced by another sentence of the same truth value," he would prove too much; one might just as well claim that the referent of "morning star" is not Venus, since one may not always say "Venus" in place of "morning star." One has the right to conclude only that the referent of a sentence is not always its truth value, and that "morning star" does not always refer to the planet Venus, namely when the word has its indirect referent. An exception of such a kind occurs in the subordinate clause just considered whose referents are thoughts.

---

5 A literal translation of Frege's "Abstrakten Nennmuthen," whose meaning eludes me.

6 In a lied in saying he had seen B, the subordinate clause designates a thought which is said (1) to have been asserted by A (2) while A was convinced of its falsity.
If one says "It seems that ..." one means "It seems to me that ..." or "I think that ...". We therefore have the same case again. The situation is similar in the case of expressions such as "to be pleased," "to regret," "to approve," "to blame," "to hope," "to fear." If, toward the end of the battle of Waterloo, Wellington was glad that the Prussians were coming, the basis for his joy was a conviction. Hard he been deceived, he would have been no less pleased so long as his illusion lasted; and before he became so convinced he could not have been pleased that the Prussians were coming—even though in fact they might have been already approaching.

Just as a conviction or a belief is the ground of a feeling, it can, as in inference, also be the ground of a conviction. In the sentence "Columbus inferred from the roundness of the earth that he could reach India by traveling towards the west," we have as referents of the parts two thoughts, that the earth is round, and that Columbus by traveling to the west could reach India. All that is relevant here is that Columbus was convinced of both, and that the one conviction was a ground for the other. Whether the earth is really round, and whether Columbus could really reach India by traveling to the west are immaterial to the truth of our sentence; but it is not immaterial whether we replace "the earth" by "the planet which is accompanied by a moon whose diameter is greater than the fourth part of its own." Here also we have the indirect referents of the words.

Adverbial clauses of purpose beginning with "in order to" also belong here; for obviously the purpose is a thought; therefore: indirect referents for the words, subjunctive mood.

A subordinate clause with "that" after "command," "ask," "forbid," would appear in direct speech as an imperative. Such a clause has no referent but only a sense. A command, a request, are indeed not thoughts, yet they stand on the same level as thoughts. Hence in subordinate clauses depending upon "command," "ask," etc., words have their indirect referents. The referent of such a clause is therefore not a truth value but a command, a request, and so forth.

The case is similar for the dependent question in phrases such as "doubt whether," "not to know what." It is easy to see that here also the words are to be taken to have their indirect referents. Dependent clauses expressing questions and beginning with "who," "what," "where," "when," "how," "by what means," etc., seem at times to approximate very closely to adverbial clauses in which words have their customary referents. These cases are distinguished linguistically by the mood of the verb. In the case of the subjunctive, we have a dependent question and indirect reference of the words, so that a proper name cannot in general be replaced by another name of the same object.

In the cases so far considered the words of the subordinate clauses had their indirect referents, and this made it clear that the referent of the subordinate clause itself was indirect, i.e., not a truth value but a thought, a command, a request, a question. The subordinate clause could be regarded as a noun, indeed one could say: as a proper name of that thought, that command, etc., which it represented in the context of the sentence structure.

We now come to other subordinate clauses, in which the words do have their customary referents without however a thought occurring as sense and a truth value as referent. How this is possible is best made clear by examples.

He who discovered the elliptic form of the planetary orbits died in misery.

If the sense of the subordinate clause were here a thought, it would have to be possible to express it also in a separate sentence. But this does not work, because the grammatical subject "he" has no independent sense and only mediates the relations with the consequent clause "died in misery." For this reason the sense of the subordinate clause is not a complete thought, and its referent is Kepler, not a truth value. One might object that the sense of the whole does contain a thought as part, namely, that there was somebody who first discovered the elliptic form of the planetary orbits; for whoever takes the whole to be true cannot deny this part. This is undoubtedly so but only because otherwise the subordinate clause "he who discovered the elliptic form of the planetary orbits" would have no referent. If anything is asserted there is always an obvious presupposition that the simple or compound proper names used have referents. If one therefore asserts "Kepler died in misery," there is a presupposition that the name "Kepler" designates something; but it does not follow that the sense of the sentence "Kepler died in misery" contains the thought that the name "Kepler" designates something. If this were the case the negation would have to run:

Kepler did not die in misery

That the name "Kepler" designates something is just as much a presupposition for the assertion

Kepler died in misery

as for the contrary assertion. Now languages have the fault of containing expressions which fail to designate an object (although their grammatical form seems to qualify them for that purpose) because the truth of some sentences is a prerequisite. Thus it depends on the truth of the sentence

There was someone who discovered the elliptic form of the planetary orbits

whether the subordinate clause

He who discovered the elliptic form of the planetary orbits

really designates an object or only seems to do so while having in fact no referent. And thus it may appear as if our subordinate clause contains as a part of its sense the thought that there was somebody who discovered the elliptic form of the planetary orbits. If this were right the negation would run:

Either he who discovered the elliptic form of the planetary orbits did not die in misery or there was nobody who discovered the elliptic form of the planetary orbs.

[fn] Prussics use the Prussian name for the battle—"Belle Alliance."
This arises from an incompleteness of language, from which even the symbolic language of mathematical analysis is not altogether free; even there combinations of symbols can occur which appear to refer to something having (at any rate so far) no referent, e.g., divergent inﬁnite series. This can be avoided, e.g., by means of the special stipulation that divergent inﬁnite series shall refer to the number 0. A logically complete language (Begriffsschrift) should satisfy the conditions, that every expression grammatically well constructed as a proper name out of signs already introduced shall in fact designate an object, and that no new sign shall be introduced as a proper name without having a referent assured. The logic books contain warnings against logical mistakes arising from the ambiguity of expressions. I regard as no less pertinent a warning against apparent proper names having no referents. The history of mathematics supplies errors which have arisen in this way. This lends itself to demagogic abuse as easily as ambiguity—perhaps more easily. "The will of the people" can serve as an example; for it is easy to establish that there is at any rate no generally accepted referent for this expression. It is therefore by no means unimportant to eliminate the source of these mistakes, at least in science, once and for all. Then such objections as the one discussed above would become impossible, because it could never depend upon the truth of a thought whether a proper name had a referent.

With the consideration of these noun clauses may be coupled that of types of adjectival and adverbial clauses which are logically closely related to them.

Adjectival clauses also serve to construct compound proper names even if, unlike noun clauses, they are not sufﬁcient by themselves for this purpose. These adjectival clauses are to be regarded as equivalent to adjectives. Instead of "the square root of 4 which is smaller than 0," one can also say "the negative square root of 4." We have here the case of a compound proper name constructed from the predicate expression with the help of the singular deﬁnite article. This is at any rate permissible if the predicate applies to one and only one single object.8

Predicate expressions can be so constructed that characteristics are given by adjectival clauses as, in our example, by the clause "which is smaller than 0." It is evident that such an adjectival clause cannot have a thought as sense or a truth value as referent, any more than the noun clause could. Its sense, which can also be expressed in many cases by a single adjective, is only a part of a thought. Here, as in the case of the noun clause, there is no independent subject and therefore no possibility of reproducing the sense of the subordinate clause in an independent sentence.

Places, instants, stretches of time, are, logically considered, objects; hence the linguistic designation of a deﬁnite place, a deﬁnite instant, or a stretch of time is to be regarded as a proper name. Now adverbial clauses of place and time can be used for the construction of such a proper name in a manner similar to that which we have seen in the case of noun and adjectival clauses. In the same way, predicate expressions containing reference to places, etc., can be constructed. It is to be noted here also that the sense of these subordinate clauses cannot be reproduced in an independent sentence, since an essential component, namely the determination of place or time, is missing and is only indicated by a relative pronoun or a conjunction.9

In conditional clauses, also, there may usually be recognized to occur an indeﬁnite indicator, having a similar correlate in the dependent clause. (We have already seen this occur in noun, adjectival, and adverbial clauses.) Insofar as each indicator refers to the other, both clauses together form a connected whole, which as a rule expresses only a single thought. In the sentence

If a number is less than 1 and greater than 0, its square is less than 1 and greater than 0

the component in question is "a number" in the conditional clause and "its square" in the dependent clause. It is by means of this very indeﬁniteness that the sense acquires the generality expected of a law. It is this which is responsible for the fact that the antecedent clause alone has no complete thought as its sense and in combination with the consequent clause expresses one and only one thought, whose parts are no longer thoughts. It is, in general, incorrect to say that in the hypothetical judgment two judgments are put in reciprocal relationship. If this or something similar is said, the word "judgment" is used in the same sense as I have connected with the word. "thought," so that I would use the formulation: "A hypothetical thought establishes a reciprocal relationship between two thoughts." This could be true only if an indeﬁnite indicator is absent;10 but in such a case there would also be no generality.

If an instant of time is to be indeﬁnitely indicated in both conditional and dependent clauses, this is often achieved merely by using the present tense of the verb, which in such a case however does not indicate the temporal present. This grammatical form is then the indeﬁnite indicator in the main and subordinate clauses.

---

8 In accordance with what was said above, an expression of the kind in question must actually always be secured of a referent, by means of a special stipulation, e.g., by the convention that 0 shall count as its referent, when the predicate applies to no object or to more than one.

9 In the case of those sentences, various interpretations are easily possible. The sense of the sentence, "After Schleswig-Holstein was separated from Denmark, Prussia and Austria quarreled" can also be rendered in the form "After the separation of Schleswig-Holstein from Denmark, Prussia and Austria quarreled." In this version, it is surely sufﬁciently clear that the sense is not to be taken as having as a part the thought that Schleswig-Holstein was once separated from Denmark, but that this is the necessary presupposition in order for the expression "after the separation of Schleswig-Holstein from Denmark" to have any referent at all. To be sure, our sentence can also be interpreted as saying that Schleswig-Holstein was once separated from Denmark. We then have a case which is to be considered later. In order to understand the difference more clearly, let us project ourselves into the mind of a Chinese who, having little knowledge of European history, believes it to be false that Schleswig-Holstein was ever separated from Denmark. He will take our sentence, in the ﬁrst version, to be either true or false but will deny it to have any referent, on the ground of absence of reference or its subordinate clause. This clause would only apparently determine a time, if he interpreted our sentence in the second way, however, he would find a thought expressed in it, which he would take to be false, besides a part which would be without reference for him.

10 At times an explicit linguistic indication is missing and must be read off from the entire context.
clauses. An example of this is: "When the sun is in the tropic of cancer, the longest day in the northern hemisphere occurs." Here, also, it is impossible to express the sense of the subordinate clause in a full sentence, because this sense is not a complete thought. If we say: "The sun is in the tropic of cancer," this would refer to our present time and thereby change the sense. Just as little is the sense of the main clause a thought; only the whole, composed of main and subordinate clauses, is such. It may be added that several common components in the antecedent and consequent clauses may be indefinitely indicated.

It is clear that noun clauses with "who" or "what" and adverbial clauses with "where," "when," "wherever," "whenever" are often to be interpreted as having the sense of conditional clauses, e.g., "who touches pitch, defiles himself.

Adjective clauses can also take the place of conditional clauses. Thus the sense of the sentence previously used can be given in the form "The square of a number which is less than 1 and greater than 0 is less than 1 and greater than 0.

The situation is quite different if the common component of the two clauses is designated by a proper name. In the sentence:

Napoleon, who recognized the danger to his right flank, himself led his guards against the enemy position.

two thoughts are expressed:

1. Napoleon recognized the danger to his right flank
2. Napoleon himself led his guards against the enemy position.

When and where this happened is to be fixed only by the context, but is nevertheless to be taken as definitely determined thereby. If the entire sentence is uttered as an assertion, we thereby simultaneously assert both component sentences. If one of the parts is false, the whole is false. Here we have the case that the subordinate clause by itself has a complete thought as sense (if we complete it by indication of place and time). The referent of the subordinate clause is accordingly a truth value. We can therefore expect that it may be replaced, without harm to the truth value of the whole, by a sentence having the same truth value. This is indeed the case; but it is to be noticed that for purely grammatical reasons, its subject must be "Napoleon," for only then can it be brought into the form of an adjective clause belonging to "Napoleon." But if the demand that it be expressed in this form be waived, and the connection be shown by "and," this restriction disappears.

Subsidiary clauses beginning with "although" also express complete thoughts. This conjunction actually has no sense and does not change the sense of the clause but only illuminates it in a peculiar fashion. We could indeed replace the conditional clause without harm to the truth of the whole by another of the same truth value; but the light in which the clause is placed by the conjunction might then easily appear unsuitable, as if a song with a sad subject were to be sung in a lively fashion.

In the last cases the truth of the whole included the truth of the component clauses. The case is different if a conditional clause expresses a complete thought by containing, in place of an indefinite indicator, a proper name or something which is to be regarded as equivalent. In the sentence

If the sun has already risen, the sky is very cloudy

the time is the present, that is to say, definite. And the place is also to be thought of as definite. Here it can be said that a relation between the truth values of conditional and dependent clauses has been asserted, namely such that the case does not occur in which the antecedent clause refers to the true and the consequent to the false. Accordingly, our sentence is true when the sun has not yet risen, whether the sky is very cloudy or not, and also when the sun has risen and the sky is very cloudy. Since only truth values are here in question, each component clause can be replaced by another of the same truth value without changing the truth value of the whole. To be sure, the light in which the subject then appears would usually be unsuitable; the thought would easily seem distorted; but this has nothing to do with its truth value. One must always take care not to clash with the subsidiary thoughts, which are however not explicitly expressed and therefore should not be reckoned in the sense. Hence, also, no account need be taken of their truth values.

The simple cases have now been discussed. Let us review what we have learned!

The subordinate clause usually has for its sense a thought, but only a part of one, and consequently no truth value as referent. The reason for this is either that the words in the subordinate clause have indirect reference, so that the referent, not the sense, of the subordinate clause is a thought; or else that, on account of the presence of an indefinite indicator, the subordinate clause is incomplete and expresses a thought only when combined with the main clause. It may happen, however, that the sense of the subsidiary clause is a complete thought, in which case it can be replaced by another of the same truth value without harm to the truth of the whole—provided there are no grammatical obstacles.

An examination of all the subordinate clauses which one may encounter will soon provide some which do not fit well into these categories. The reason, so far as I can see, is that these subordinate clauses have no such simple sense. Almost always, it seems, we connect with the main thoughts expressed by us subsidiary thoughts which, although not expressed, are associated with our words, in accordance with psychological laws, by the hearer. And since the subsidiary thought appears to be connected with our words of its own accord, almost like the main thought itself, we want it also to be expressed. The sense of the sentence is thereby enriched, and it may well happen that we have more simple thoughts than clauses. In many cases the sentence must be understood in this way, in others it may be

12 Similarly in the case of "but," "yet."
do not indicate whether the subsidiary thought belongs to the sense of the sentence or only accompanies it? One might perhaps find that the sentence

Napoleon, who recognized the danger to his right flank, himself led his guards against the enemy position

expresses not only the two thoughts shown above, but also the thought that the knowledge of the danger was the reason why he led the guards against the enemy position. One may in fact doubt whether this thought is merely lightly suggested or really expressed. Let the question be considered whether our sentence be false if Napoleon’s decision had already been made before he recognized the danger. If our sentence could be true in spite of this, the subsidiary thought should not be understood as part of the sense. One would probably decide in favor of this. The alternative would make for a quite complicated situation: We would have more simple thoughts than clauses. If the sentence

Napoleon recognized the danger to his right flank

were now to be replaced by another having the same truth value, e.g.,

Napoleon was already more than 45 years old

not only would our first thought be changed, but also our third one. Hence the truth value of the latter might change—namely, if his age was not the reason for the decision to lead the guards against the enemy. This shows why clauses of equal truth value cannot always be substituted for one another in such cases. The clause expresses more through its connection with another than it does in isolation.

Let us now consider cases where this regularly happens. In the sentence

Bebel mistakenly supposes that the return of Alsace-Lorraine would appease France’s desire for revenge

two thoughts are expressed, which are not however shown by means of antecedent and consequent clauses, viz.: (1) Bebel believes that the return of Alsace-Lorraine would appease France’s desire for revenge (2) the return of Alsace-Lorraine would not appease France’s desire for revenge.

In the expression of the first thought, the words of the subordinate clause have their indirect referents, while the same words have their customary referents in the expression of the second thought. This shows that the subordinate clause in our original complex sentence is to be taken twice over, with different referents, of which one is a thought, the other a truth value. Since the truth value is not the whole referent of the subordinate clause, we cannot simply replace the latter by another of equal truth value. Similar considerations apply to expressions such as “know,” “discover,” “it is known that.”

By means of a subordinate clause of reason and the associated main clause we express several thoughts, which however do not correspond separately to the original clauses. In the sentence

Because ice is less dense than water, it floats on water

we have

(1) Ice is less dense than water;
(2) If anything is less dense than water, it floats on water;
(3) Ice floats on water.

The third thought, however, need not be explicitly introduced, since it is contained in the remaining two. On the other hand, neither the first and third nor the second and third combined would furnish the sense of our sentence. It can now be seen that our subordinate clause

because ice is less dense than water

expresses our first thought, as well as a part of our second. This is how it comes to pass that our subsidiary clause cannot be simply replaced by another of equal truth value; for this would alter our second thought and thereby easily alter its truth value.

The situation is similar in the sentence

If iron were less dense than water, it would float on water.

Here we have the two thoughts that iron is not less dense than water, and that something floats on water if it is less dense than water. The subsidiary clause again expresses one thought and a part of the other.

If we interpret the sentence already considered

After Schleswig-Holstein was separated from Denmark, Prussia and Austria quarreled

in such a way that it expresses the thought that Schleswig-Holstein was once separated from Denmark, we have first this thought, and secondly the thought that at a time, more closely determined by the subordinate clause, Prussia and Austria quarreled. Here also the subordinate clause expresses not only one thought but also a part of another. Therefore it may not in general be replaced by another of the same truth value.

It is hard to exhaust all the possibilities given by language; but I hope to have brought to light at least the essential reasons why a subordinate clause may not always be replaced by another of equal truth value without harm to the truth of the whole sentence structure. These reasons arise:

(1) when the subordinate clause does not refer to a truth value, inasmuch as it expresses only a part of a thought;
(2) when the subordinate clause does refer to a truth value but is not restricted to so doing, inasmuch as its sense includes one thought and part of another.

This may be important for the question whether an assertion is a lie, or an oath a perjury.
The first case arises:
(a) in indirect reference of words
(b) if a part of the sentence is only an indefinite indicator instead of a proper name.

In the second case, the subsidiary clause may have to be taken twice over, viz., once in its customary reference, and the other time in indirect reference; or the sense of a part of the subordinate clause may likewise be a component of another thought, which, taken together with the thought directly expressed by the subordinate clause, makes up the sense of the whole sentence.

It follows with sufficient probability from the foregoing that the cases where a subordinate clause is not replaceable by another of the same value cannot be brought in disproof of our view that a truth value is the referent of a sentence having a thought as its sense.

Let us return to our starting point!

If we found "a = a" and "a = b" to have different cognitive values, the explanation is that for the purpose of knowledge, the sense of the sentence, viz., the thought expressed by it, is no less relevant than its referent, i.e., its truth value. If now a = b, then indeed the referent of "b" is the same as that of "a," and hence the truth value of "a = b" is the same as that of "a = a." In spite of this, the sense of "b" may differ from that of "a," and thereby the sense expressed in "a = b" differs from that of "a = a." In that case the two sentences do not have the same cognitive value. If we understand by "judgment" the advance from the thought to its truth value, as in the above paper, we can also say that the judgments are different.

OF NAMES

John Stuart Mill

I. Names Are Names of Things, Not Of Our Ideas

"A name," says Hobbes, "is a word taken at pleasure to serve for a mark which may raise in our mind a thought like to some thought we had before, and which, being pronounced to others, may be to them a sign of what thought the speaker had before in his mind." This simple definition of a name as a word (or set of words) serving the double purpose of a mark to recall to ourselves the likeness of a former thought and a sign to make it known to others appears unexceptionable. Names, indeed, do much more than this, but whatever else they do grow out of and is the result of this, as will appear in its proper place.

II. General and Singular Names

All names are names of something, real or imaginary, but all things have not names appropriated to them individually. For some individual objects we require and, consequently, have separate distinguishing names; there is a name for every person and for every remarkable place. Other objects of which we have no occasion to speak so frequently we do not designate by names of their own; but when the necessity arises for naming them, we do so by putting together several words, each of which, by itself, might be and is used for an indefinite number of other objects, as when I say, "this stone": "this" and "stone" being, each of them, names that may be used of many other objects besides the particular one meant, though the only object of which they can both be used at the given moment, consistently with their signification, may be the one of which I wish to speak.

Were this the sole purpose for which names that are common to more things than one could be employed, if they only served, by mutually limiting each other, to afford a designation for such individual objects as have no names of their own, they could only be ranked among contrivances for economising the use of language. But it is evident that this is not their sole function. It is by their means that we are enabled to assert general propositions, to affirm or deny any predicate of an indefinite number of things at once. The distinction, therefore, between general names and individual or singular names is fundamental, and may be considered as the first grand division of names.

A general name is, familiarly defined, a name which is capable of being truly affirmed, in the same sense, of each of an indefinite number of things. An individual or singular name is a name which is only capable of being truly affirmed, in the same sense, of one thing.

Thus, man is capable of being truly affirmed of John, George, Mary, and other persons without assignable limit, and it is affirmed of all of them in the same sense, for the word "man" expresses certain qualities, and when we predicate it of those persons, we assert that they all possess those qualities. But John is only capable of being truly affirmed of one single person, at least in the same sense. For, though there are many persons who bear that name, it is not conferred upon them to indicate any qualities or any thing which belongs to them in common, and cannot be said to be affirmed of them in any sense at all, consequently not in the same sense.

"The king who succeeded William the Conqueror" is also an individual name. For that there cannot be more than one person of whom it can be truly affirmed is implied in the meaning of the words. Even "the king," when the occasion or the context defines the individual of whom it is to be understood, may justly be regarded as an individual name.

It is necessary to distinguish general from collective names. A general name is one which can be predicated of each individual of a multitude; a collective name cannot be predicated of each separately, but only of all taken together. "The seventy-sixth regiment of foot in the British army," which is a collective name, is not a general but an individual name, for though it can be predicated of a multitude of individual soldiers taken jointly, it cannot be predicated of them severally. We may say, "Jones is a soldier, and Thompson is a soldier, and Smith is a soldier," but we cannot say, "Jones is the seventy-sixth regiment, and Thompson is the seventy-sixth regiment, and Smith is the seventy-sixth regiment." We can only say, "Jones, and Thompson, and Smith, and Brown, and so forth (enumerating all the soldiers) are the seventy-sixth regiment."
